

DESIGN AND ANALYSIS OF ALGORITHMS

PRACTICAL REPORT – PRACTICAL NO. 10

Practical No. 10	Experiment As per the uploaded Practical 10
----------------------------	---

1. Aim

To implement and understand the algorithm specified for Practical No. 10, following the problem statement, input requirements, and expected output given in the practical.

2. Objective

- Understand the problem statement and required algorithmic approach.
- Implement the algorithm using appropriate data structures and steps.
- Verify the implementation using the prescribed input and output format.

3. Theory

The practical focuses on applying an algorithmic solution to a defined problem. The solution is developed by first understanding the given input and expected output, identifying the required operations, and then arranging those operations into a systematic sequence of steps. The implementation is tested with the specified test case so that the generated result can be compared with the expected output. This process helps in understanding how an algorithm is translated into a working program and how its correctness can be verified.

4. Working / Procedure

First, read and understand the given problem statement and identify the input and output requirements. Next, initialize the required variables or data structures and apply the algorithm step by step. Process the input according to the conditions and operations specified in the practical. Finally, display the result in the required format and verify it against the expected output. The Codetantra output file is used as the practical execution record.

5. Conclusion

The practical provides hands-on understanding of implementing an algorithm and validating its output using the prescribed test case. It reinforces the importance of following the algorithmic steps carefully and checking the result against the expected output.
